

How to listen to Wullie's HF net on-line *just use your computer or cell phone !*

You'll be listening to a software defined receiver situated at Malin Head on the very northern tip of Ireland. Your host is Finbar O'Connor - EI0CF

Start by going to this link:

<http://malinheadkiwi.hopto.org:8073>

You'll see this opening page...

The screenshot shows the KiwiSDR web interface. At the top, it displays 'KiwiSDR in County Donegal, Ireland' with location details and antenna information. The main area features a waterfall display showing frequency activity. A purple 'Welcome!' box is on the left. On the right, there are control panels for frequency selection (7112.00 MHz), mode selection (LSB), and various settings like gain and auto scale. Three yellow annotations are present: '1. Enter frequency here' pointing to the frequency input, '2. Click LSB button' pointing to the mode selection, and '3. Click plus spyglass (+) several times to adjust appearance of the waterfall to your liking' pointing to the zoom icons.

Highlight the frequency slot and enter the numbers 7112 and hit <enter>. Now you are tuned into the correct frequency.

Make sure LSB is clicked.

You should hear something through your speakers.

If not, turn it up!

Then, click the plus (+) spyglass icon to broaden the appearance of your waterfall display to your liking. The waterfall lets you see all the frequencies nearby visually.

To change frequency, just enter new numbers in the frequency slot and hit <enter>.
